

DDL – COMMENT Statement

1. What is a Comment?

English: A comment is a note or explanation written inside an SQL program. It helps the programmer understand the purpose of a statement. The database does not execute the comment.

Tamil: Comment ██████ SQL program-██ ███ statement-██ purpose ██████ explanation-██
 ████████████████████ ████████████. Database comment-█ execute ██████████.

2. Why are Comments Used?

- To explain the purpose of a DDL statement.
- To make SQL code easy to read and understand.
- To add notes for future reference.
- Comments do not affect the execution of SQL commands.

3. Types of SQL Comments

Type	Syntax	Use
Single-line	-- comment	For one line
Multi-line	/* comment */	For multiple lines

4. Single-line Comment Example

```
-- Creating a Student table
CREATE TABLE Student (
    ID INT,
    Name VARCHAR(50)
);
```

Explanation: The line beginning with -- is a comment. The database ignores that line and executes the CREATE TABLE statement.

5. Multi-line Comment Example

```

/*
    This table stores student details.
    ID stores the student number.
*/
CREATE TABLE Student (
    ID INT,
    Name VARCHAR(50)
);

```

Explanation: Text between `/*` and `*/` is treated as a multi-line comment.

6. Exam – 2 Mark Answer

Comment: A comment is a non-executable note used to explain or document SQL statements. Single-line comments use `--`, while multi-line comments use `/* */`. Comments are ignored during SQL execution.

Tamil Quick Meaning

[illegible]
